 THE LIGHT EXPERTS

iDrive

IDEVC161

iDrive throttle controller modifies the voltage signal from the fly-by-wire pedal assembly to allow greater response from the accelerator pedal and reduce throttle lag.

iDrive throttle controllers work in two main ways. When you first depress the pedal, there is what is referred to as a dead zone, where there is very little response no matter how hard you hit the pedal, nothing happens. The iDrive converts this dead signal to action, completely eliminating the dead zone.

The second part of the iDrive's function is opening the throttle earlier in the pedal stroke, which cannot be replicated by pressing harder on the pedal.

Features:

- plugs directly into your gas pedal command module
- suitable for most vehicles built after 2000
- can be programmed to both manual and automatic transmissions
- equipped with intuitive display settings manu for ease of use
- four different modes with over twenty adjustable settings
- easy to install

Seat Covers

Seat Covers - Airbag Compatible
